Summary Post

by Jaafar El Komati - Wednesday, 13 August 2025, 8:38 PM

The discussion on Agent-based System (ABS) exposed their growing importance as a flexible and intelligent approach to automation, especially in dynamic, data-driven industries. In my initial post, I outlined how progress in large language models (LLM) such as Cloud 3.5 and Gemini 2.0 has accelerated the adoption of ABS by enabling agents with to reason, plan and execute tasks with minimal human input (Sapkota, Rumliyotis and Karki, 2025). I also noted their modular designs, adaptability and business effects, including more than 30% productivity gains (CRN, 2025).

My peers extended this perspective with important ideas. Linga emphasized possible challenges in accountability, trust and coordination when agents operate autonomously, citing the risks of conflicting objectives and unpredictable results (Genings and Woldridges, 1998). He highlighted the growing role of governance models and hybrid human-in-loop systems to address these concerns, especially under regulations such as the European Union AI Act (European Commission, 2024).

Abdulrahman emphasized the need for robust governance, data integrity safeguards, simulation-based tests, and operating risks (Oluzimi, 2025; Sawant, 2025). His focus on "Digital Sandbox" offered a practical method for pre-deployment testing to prevent agents' conflicts.

Nasser said that while decentralization increases adaptability, it also introduces interoperability, data privacy and oversight challenges (de vits, 2025). He highlighted that successful ABS deployment depends on balanced autonomy with organizational objectives and maintains strong coordination and security protocol (Woldridge, 2009).

Finally, the discussion made one thing clear: ABS is not just another automation tool, but how the intelligent system is designed and managed, it has a fundamental change. Its actual value lies in increasing autonomy without losing control, ensuring morality and governance in its foundation, and ensuring continuous and adaptive oversight. When these elements work together, the ABS becomes a collaborative partner for the organization, which rapidly promotes trusts, safety and flexibility in the complex digital world.
